EXP NO: 1 Exchange of the Values

DATE: 07/12/22

#### **AIM:**

To Perform swapping of two values using simple statements and expressions in Python

## **ALGORITHM-1:**

**Step 1:** Get the value of a

**Step 2:** Get the value of b

**Step 3:** Assign the value of temp=0

Step 4: Display The value before Swapping a,b

Step 5: temp=a

**Step 6:** a=b

Step 7: b=temp

**Step 8:** Display The value after Swapping a,b

Step 9: Stop

#### **PROGRAM-1:**

```
a=int(input("Enter number 1:"))
```

b=int(input("Enter number 2:"))

temp=0

print("The values before swapping :",a," ",b)

temp=a

a=b

b=temp

print("The values after swapping :",a," ",b)

#### **OUTPUT-1:**

Enter number 1:5

Enter number 2:2

The values before swapping: 5 2

The values after swapping: 2 5

**ROLL NO:22CSEB59** 

## **ALGORITHM-2:**

**Step 1:** Get the value of a

**Step 2:** Get the value of b

**Step 3:** Display The value before Swapping a,b

**Step 4:** a,b=b,a

**Step 5:** Display The value after Swapping a,b

Step 6: Stop

## **PROGRAM-2:**

a=int(input("Enter number 1:"))

b=int(input("Enter number 2:"))

print("The values before swapping :",a," ",b)

a,b=b,a

print("The values after swapping :",a," ",b)

## **OUTPUT-2:**

Enter number 1:5

Enter number 2:2

The values before swapping: 5 2

The values before swapping: 2 5

ROLL NO:22CSEB59

## **ALGORITHM-3:**

**Step 1:** Get the value of a

**Step 2:** Get the value of b

Step 4: Display The value before Swapping a,b

**Step 5:** a=a+b

**Step 6:** b=a-b

**Step 7:** a=a-b

**Step 8:** Display The value after Swapping a,b

Step 9: Stop

## **PROGRAM-3:**

```
a=int(input("Enter number 1:"))
b=int(input("Enter number 2:"))
print("The values before swapping :",a," ",b)
a=a+b
b=a-b
a=a-b
print("The values after swapping :",a," ",b)
```

## **OUTPUT-3:**

Enter number 1:5

Enter number 2:2

The values before swapping: 5 2

The values after swapping: 2 5

ROLL NO:22CSEB59 NAME: VINOTH KUMAR K B

## **ALGORITHM-4:**

**Step 1:** Get the value of a

**Step 2:** Get the value of b

Step 4: Display The value before Swapping a,b

**Step 5:** a=a^b

**Step 6:** b=a^b

**Step 7:** a=a^b

Step 8: Display The value after Swapping a,b

Step 9: Stop

## **PROGRAM-4:**

a=int(input("Enter number 1:"))

b=int(input("Enter number 2:"))

print("The values before swapping :",a," ",b)

a=a+b

b=a-b

a=a-b

print("The values after swapping :",a," ",b)

#### **OUTPUT-3:**

Enter number 1:5

Enter number 2:2

The values before swapping: 5 2

The values after swapping: 2 5

ROLL NO:22CSEB59

Thus the result for the given Program is obtained.

EXP NO: 2 Circulating the List of values

DATE: 07/12/22

#### AIM:

To Perform Circulating the value in the list using simple statements and expressions in Python

#### **ALGORITHM-1:**

```
Step 1: Get the value of n
```

Step 2: Assign l[]

**Step 3:** Check for the condition for i=0 to n if true goto 4 else goto 6

**Step 4:** Get value of x

**Step 5:** append x to l[]

**Step 6:** Get number of rotation a

**Step 7:** Check for the condition for i=0 to a if true goto 8 else goto 11

**Step 8:** Assign b = 1.pop(0)

Step 9: append b to l[]

**Step 10:** Print the circulated list b

Step 11: Stop

#### **PROGRAM-1**:

```
n=int(input("Enter the number of values in the list :"))
l=[]
for i in range(0,n):
  x=int(input("Enter the value :"))
  1.append(x)
a=int(input("Enter number of rotation :"))
for i in range(0,a):
  b=1.pop(0)
```

**ROLL NO:22CSEB59** 

l.append(b)
print("The circulate list is :",l)

# **OUTPUT-1:**

Enter the number of values in the list:3

Enter the value:1

Enter the value :2

Enter the value :5

Enter number of rotation:2

The circulate list is: [2, 5, 1]

The circulate list is: [5, 1, 2]

ROLL NO:22CSEB59

# **ALGORITHM-2: Step 1:** Get the value of n Step 2: Assign l[] **Step 3:** Check for the condition for i=0 to n if true goto 4 else goto 7 **Step 4:** Get value of x **Step 5:** append x to l[] **Step 6:** Display circulating the list... **Step 7:** Get number of rotation a **Step 8:** Check for the condition for i=0 to a if true goto 9 else goto 11 **Step 9:** Compute l=l[1:]+l[:1] Step 10: Print the circulated list b Step 11: Stop **PROGRAM-2:** n=int(input("Enter the number of values in the list :")) 1=[] for i in range(0,n): x=int(input("Enter the value :")) 1.append(x) print("Circulating the list....") a=int(input("Enter the number of rotation :")) for i in range(0,a):

ROLL NO:22CSEB59

l=l[1:]+l[:1]

NAME: VINOTH KUMAR K B

print("The circulate list is :",l)

OUTPUT-2:
Enter the number of values in the list :3
Enter the value :1
Enter the value :2
Enter the value :5
Enter number of rotation :2
The circulate list is: [2, 5, 1]
The circulate list is: [5, 1, 2]

ROLL NO:22CSEB59 NAME: VINOTH KUMAR K B

Thus the result for the given Program is obtained

EXP NO: 3 Distance between Two points

DATE: 07/12/22

#### **AIM:**

To Calculate distance between Two points using simple statements and expressions in Python

## **ALGORITHM:**

Step 1: Start.

Step 2: Import math.

Step 3: Get the value of x1.

Step 4: Get the value of y1.

Step 5: Get the value of x2.

Step 6: Get the value of y2.

Step 7: Calculate the distance using the formula.

D=(pow(x2-x1,2)+pow(y2-y1,2))\*\*1/2

Step 8: Display the distance D.

Step 9: Stop.

#### **PROGRAM:**

import math

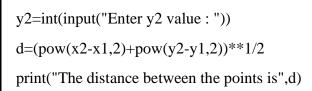

print("To find the distance between two points")

x1=int(input("Enter x1 value : "))

y1=int(input("Enter x2 value : "))

x2=int(input("Enter y1 value: "))

ROLL NO:22CSEB59

# **OUTPUT:**

To find the distance between two points

Enter x1 value : 40

Enter x2 value : 50

Enter y1 value: 35

Enter y2 value : 90

The distance between the points is 40.311288741492746

ROLL NO:22CSEB59

Thus the result for the given Program is obtained.

EXP NO : 4 TO PERFORM ARITHMETIC DATE : 07/12/22 OPERATIONS ON TWO VALUES

#### AIM:

To Perform Arithmetic operations on two values using simple statements and expressions in Python

#### **ALGORITHM:**

Step 1: Start

Step 2: Get the value of a.

Step 3: Get the value of b.

Step 4: Calculate and print "The ADDITION Value IS!".

Step 5: Calculate and prind "The SUBRACTION Value IS!".

Step 6: Calculate and print "The MULTIPLICATION value is!".

Step 1: Calculate and display" The QUOTIENT VALUE 13:'-

Step 8 Calculate and display "the REMAINDER Value IS!"

Shep 9: Stop.

#### **PROGRAM:**

```
a=int(input("Enter value of a : "))
b=int(input("Enter value of b : "))
print("The ADITTION value is : ",a+b)
print("The SUBRACTION value is : ",a-b)
```

ROLL NO:22CSEB59

print("The MULTIPLICATION value is : ",a\*b)

print("The QUOTIENT value is : ",a/b)

print("The REMAINDER value is : ",a%b)

# **OUTPUT:**

Enter value of a: 20

Enter value of b: 10

The ADITTION value is: 30

The SUBRACTION value is: 10

The MULTIPLICATION value is: 200

The QUOTIENT value is: 2.0

The REMAINDER value is: 0

ROLL NO:22CSEB59

Thus the result for the given Program is obtained.

EXP NO: 5 Weight of the apples

DATE: 07/12/22

## AIM:

To Calculate Weight of the apples using simple statements and expressions in Python

## **ALGORITHM:**

Step 1: Start

step 2: On the test of 1kg Apple W

Step 3: Enter the total weight of apples Bought

Step 4: Calculate the total cost of apple.

Step 5: Display Total cost

Step 6 Stop

## **PROGRAM:**

 $a{=}int(input("Enter\ Cost\ of\ 1\ kg\ of\ apple:"))$ 

b=int(input("Enter Total Weight of Apples Bought: "))

print("The total cost of the apple is",a\*b,"Rs/-")

#### **OUTPUT:**

Enter Cost of 1 kg of apple: 120

Enter Total Weight of Apples Bought: 5

The total cost of the apple is 600 Rs/-

ROLL NO:22CSEB59

Thus the result for the given Program is obtained

EXP NO: 6 Fahrenheit into Celsius

DATE: 07/12/22

#### **AIM:**

To Convert Fahrenheit into Celsius using simple statements and expressions in Python

### **ALGORITHM:**

Step 1 : Start

Step 2: Get the Fahrenheit value in degree a

Step 3: Calculate Celsius Fusing the formula c=(F-32)5/9.

Step 4: Display Celsius c.

Step 5: Stop.

## **PROGRAM:**

a=int(input("Enter Fahrenheit value F in degrees: "))

c=(F-32)5/9

print("The Celsius value is : ",c)

## **OUTPUT:**

Enter Fahrenheit value F in degrees : 28

The Celsius value is: 82.4

**ROLL NO:22CSEB59** 

Thus the result for the given Program is obtained.

EXP NO: 7 Calculate price of a book

DATE: 07/12/22

#### **AIM:**

To Calculate price of a book with discount using simple statements and expressions in Python

## **ALGORITHM:**

```
Step 1: Start
```

Step 2: Get the Price of book

Step 4: Calculate discount amount using formula disc = a\*5/100.

Step 5: Display the discount amount

Step 6: Display Calculate Bill price using not = a-disc

Step 7: Display the Bill Price

Step 8: Stop

#### **PROGRAM:**

```
a=int(input("Enter Price Of Book bought : "))
```

b=int(input("Enter The discount amount:"))

disc=(a\*b)/100

net=a-disc

print("The Discount price is : ",disc)

print("The Bill price is : ",net)

#### **OUTPUT:**

**ROLL NO:22CSEB59** 

Enter Price Of Book bought: 600

Enter The discount amount: 45

The Discount price is: 270.0

The Bill price is: 330.0

#### **RESULT:**

Thus the result for the given Program is obtained.

EXP NO: 8 Prime number or not

DATE: 07/12/22

#### AIM:

To Calculate Prime number or not using simple statements and expressions in Python

## **ALGORITHM:**

Step 1: Start

Step 2: initialise i=2

Step 4: Get the value to be checked as n

Step 5: Check for the condition i<=n it true goto 6 step 4.1

4.1: Divide I by n and check weather remainder is 0 increase I by 1 and goto step 4

4.2: If false goto step5

Step 7: Display the number as prime and goto step 7

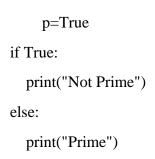

Step 6: Display not prime

Step 8: Stop

#### **PROGRAM:**

```
n=int(input("Enter number :"))
i=2
for i in range(2,n):
  if n% 1==0:
```

**ROLL NO:22CSEB59** 

# **OUTPUT:**

Enter number :4

Not Prime

Enter number :1

Prime

ROLL NO:22CSEB59

Thus the result for the given Program is obtained.

EXP NO: 9 Leap year or not

DATE: 07/12/22

## AIM:

To Calculate price of a book with discount using simple statements and expressions in Python

#### **ALGORITHM:**

Step 1: Start

Step 2: Get the Year as y

Step 4: Chech for the condition. if((y%400==0) or (y%100!=0) and (y%4==0)): if true goto step 5 else goto step 6

Step 5: Display Leap year

Step 6: Display Not a Leap year

Step 7: Display the Bill Price

Step 8: Stop

#### **PROGRAM:**

```
y=int(input("Enter number:"))

if((y%400==0) or (y%100!=0) and (y%4==0)):

print("Leap Year")
```

**ROLL NO:22CSEB59** 

else:

print("Not a Leap year")

## **OUTPUT:**

Enter number: 2020

Leap Year

Enter number:1900

Not a Leap year

## **RESULT:**

Thus the result for the given Program is obtained.

EXP NO: 10

DATE: 07/12/22

Simple Interest

## AIM:

To Calculate Simple Interest using simple statements and expressions in Python

#### **ALGORITHM:**

Step 1: Start.

step 2: Get Principle balance amount P.

Step 3: Get Annual Intrest rate r.

Step 4: Get Time in Years t.

Step 5: Calculate annual interest rate using the formula

A = p (1 + r \* t)

Step 6: Display Annual Interest rate.

Slep 7: Stop.

## **PROGRAM:**

p=float(input("Enter the Principle balance amount P : "))

r=float(input("Enter the annual interest rate r:"))

**ROLL NO:22CSEB59** 

t=float(input("Enter the Time in Years t : "))

A = p (1 + r \* t)

print("The annual interest rate is A: ",a)

# **OUTPUT:**

Enter the Principle balance amount P: 10000

Enter the annual intreat rate r: 5.6

Enter the Time in Years t: 5

The annual intrest rate is A: 280000.0

# **RESULT:**

Thus the result for the given Program is obtained.

ROLL NO:22CSEB59 NAME: VINOTH KUMAR K B
